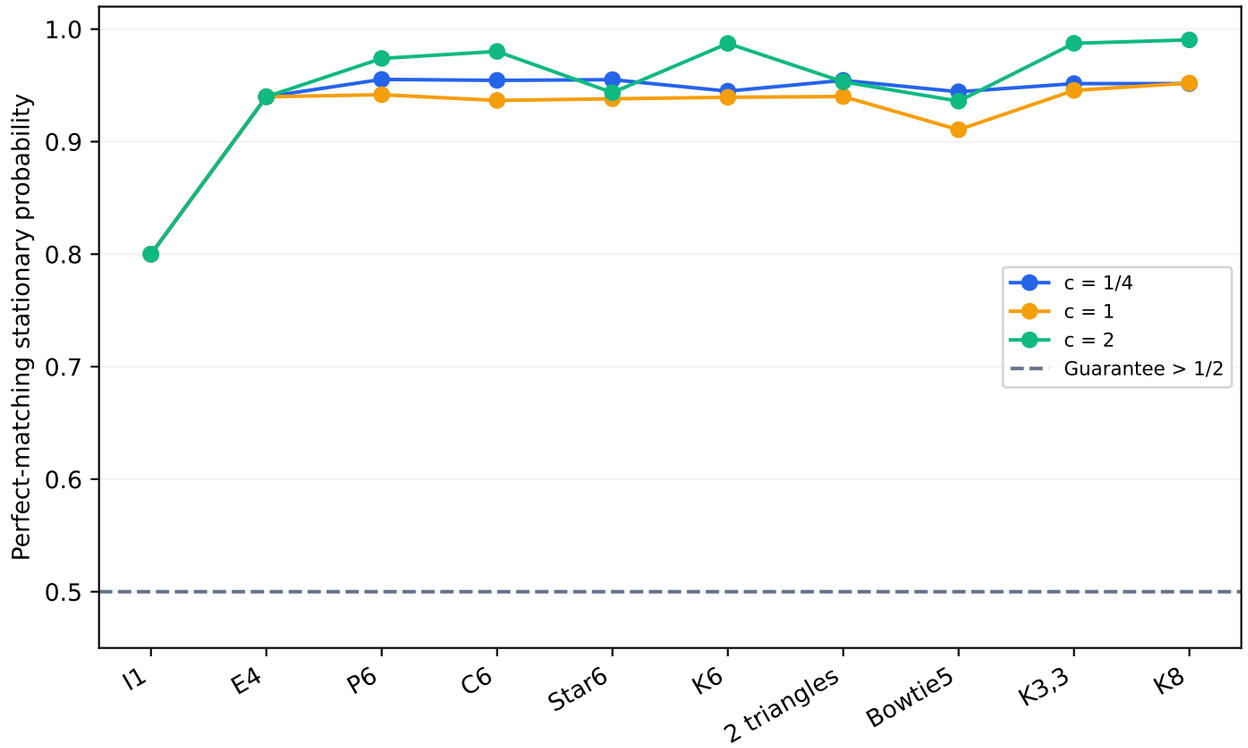
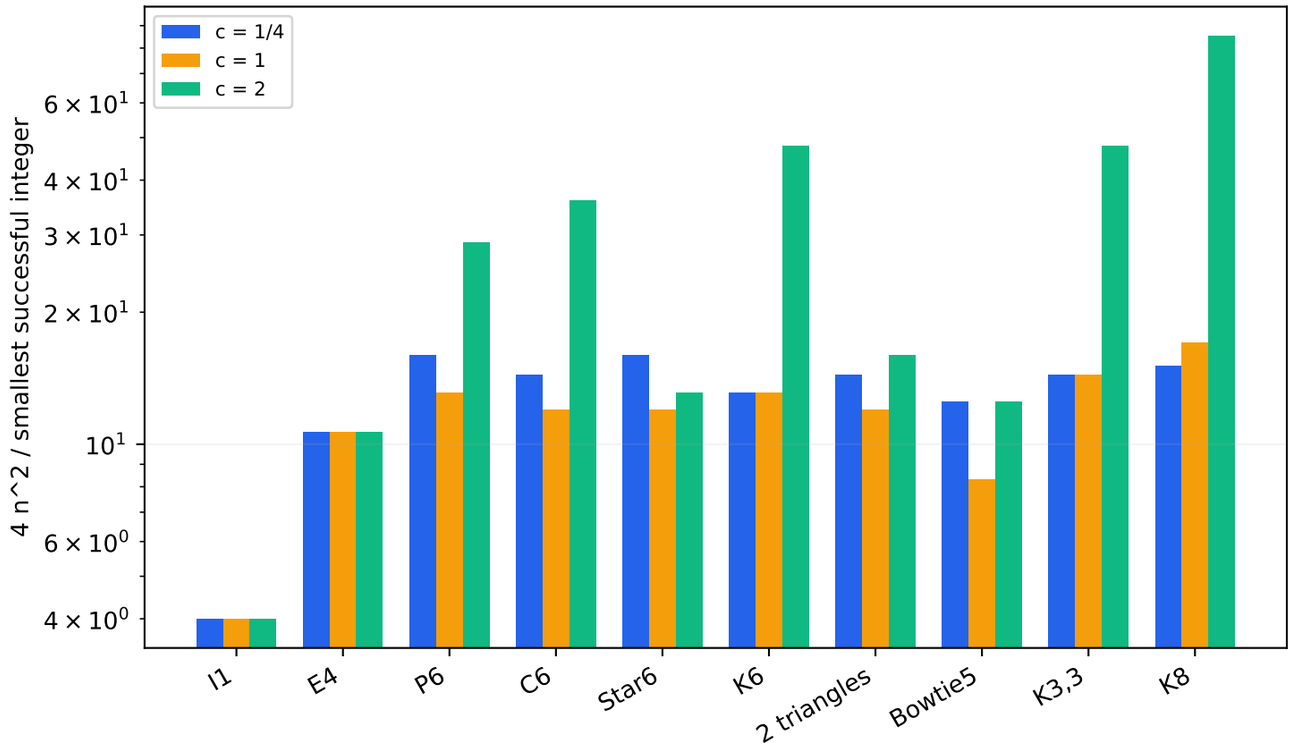
Iteration 63 | Exact graph-law construction and finite-word audit

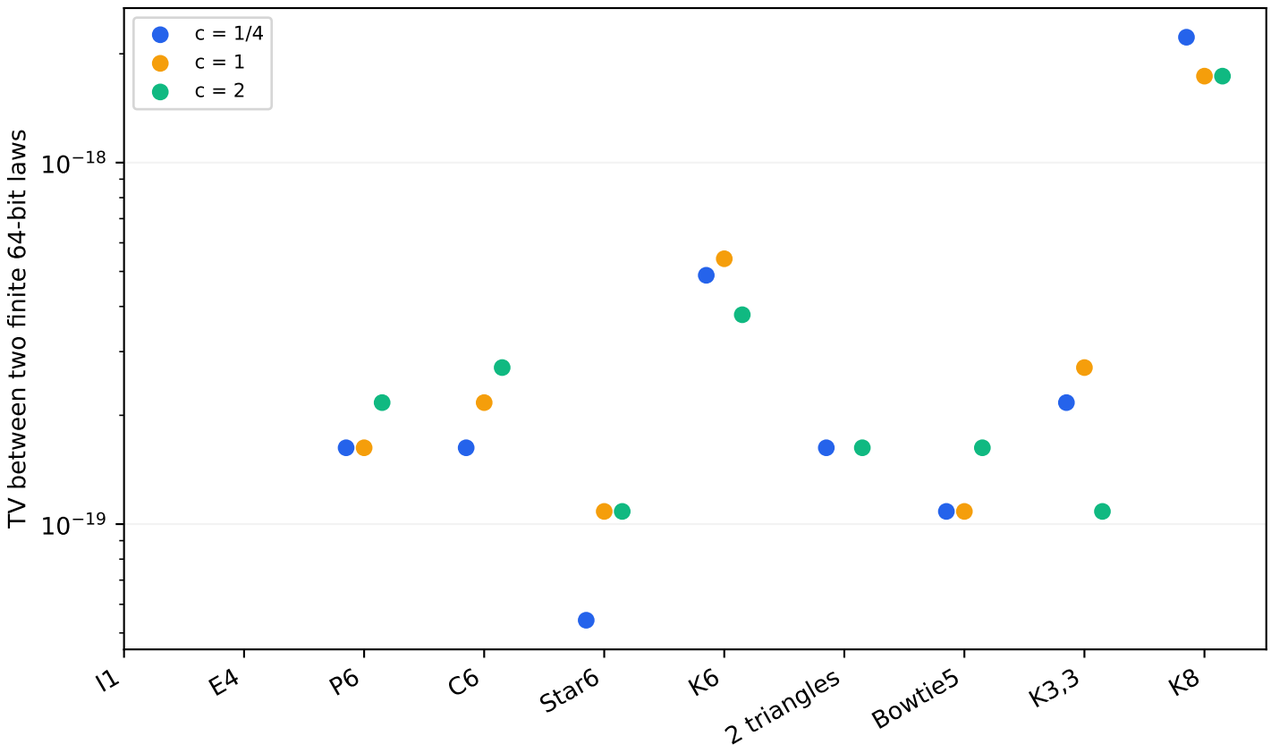
A Uniform edge multiplier 4 n^2



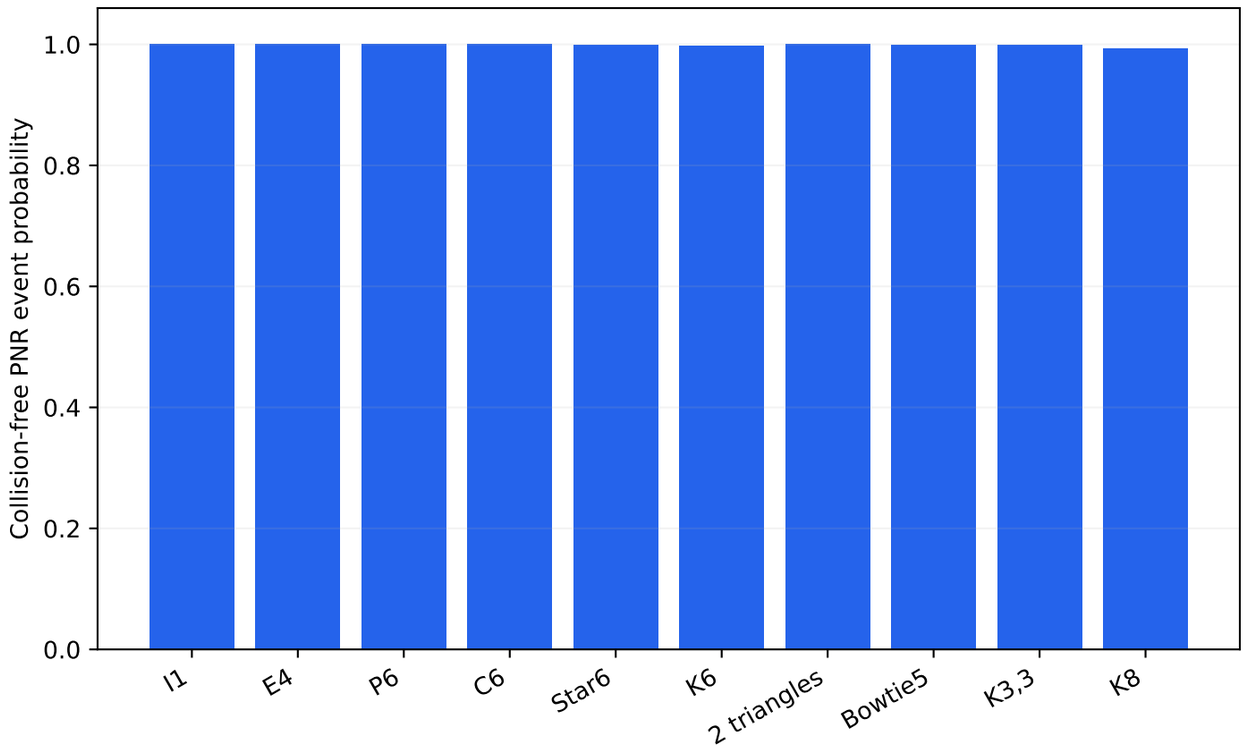
B Guarantee looseness, not measured speedup



C Natural matching order vs direct subset CDF



D Valid pure Gaussian bridge, c = 1/4



10 fixed graphs, 30 rational-parameter cases, at most 8 graph vertices. Exact exponential tables; no Markov-chain runtime result.
Grouped matching CDF equals direct subset CDF in every case. The graph law is conditional on collision-free PNR output.
