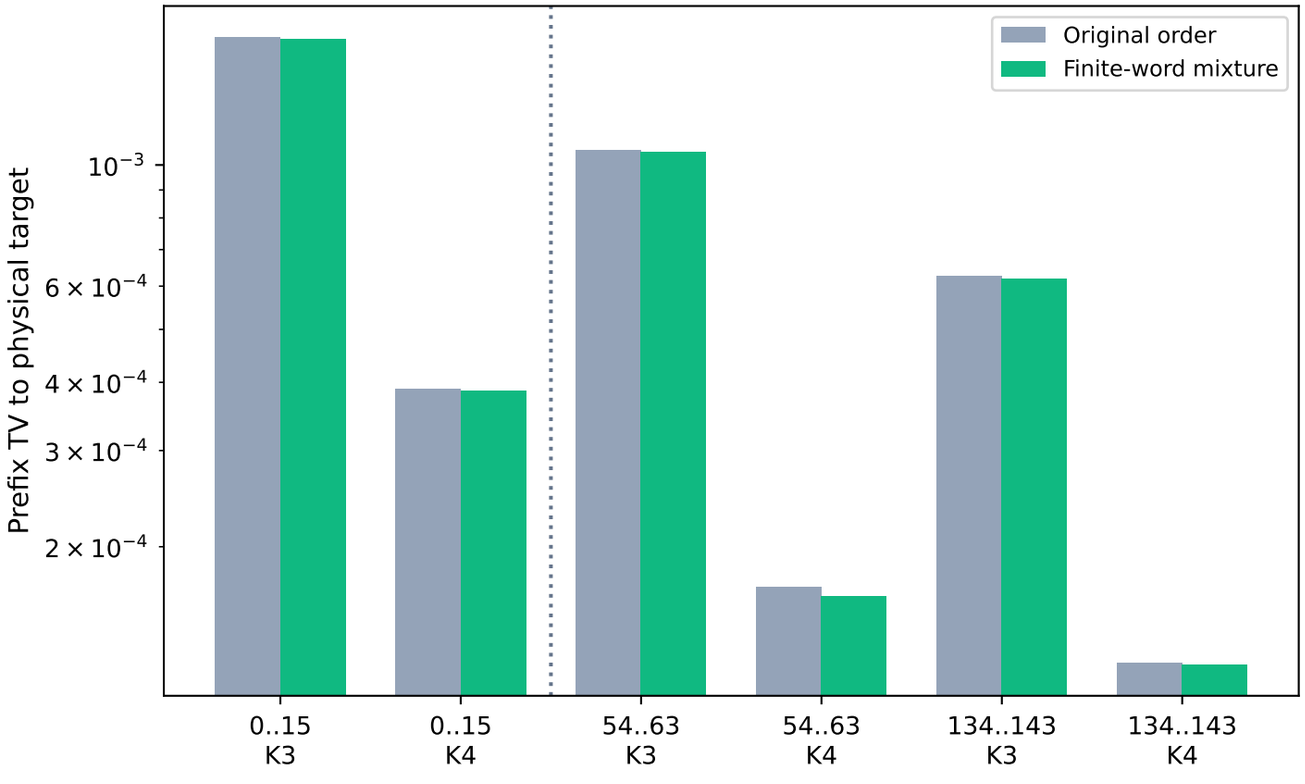
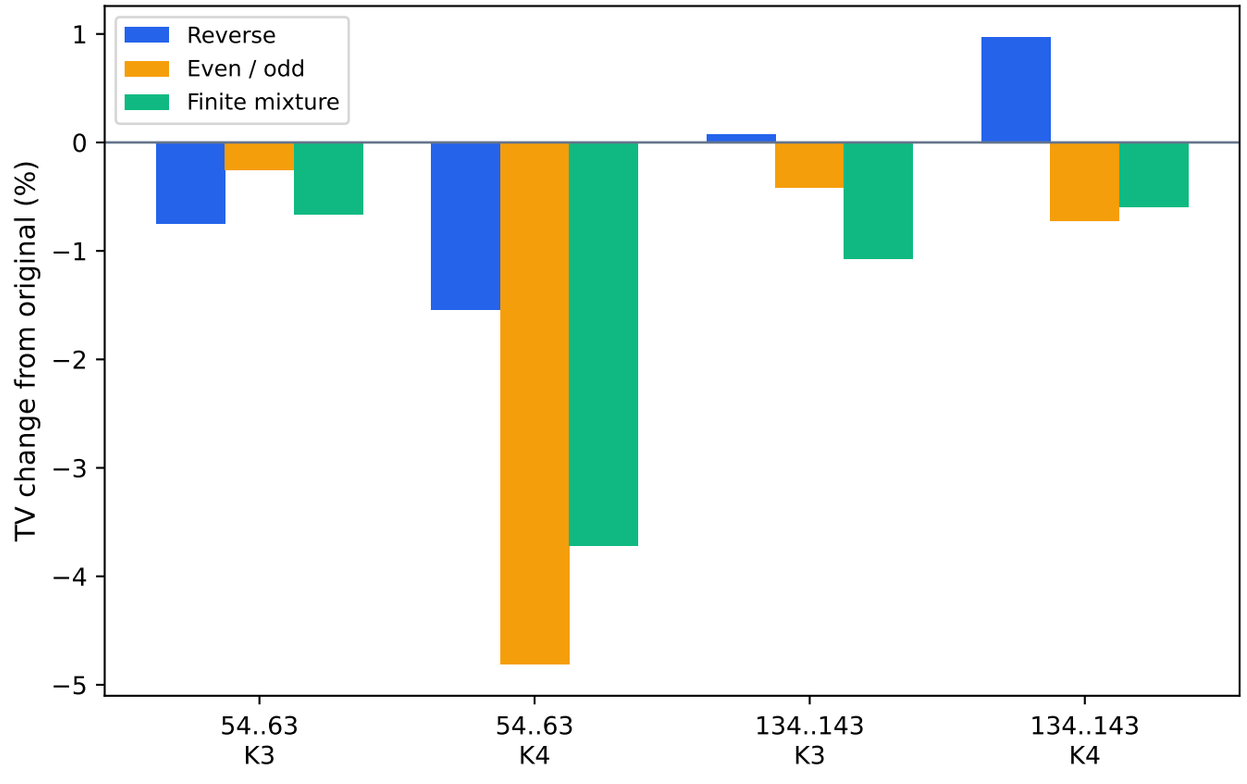
Iteration 62 | Finite-word mixture on fixed physical windows

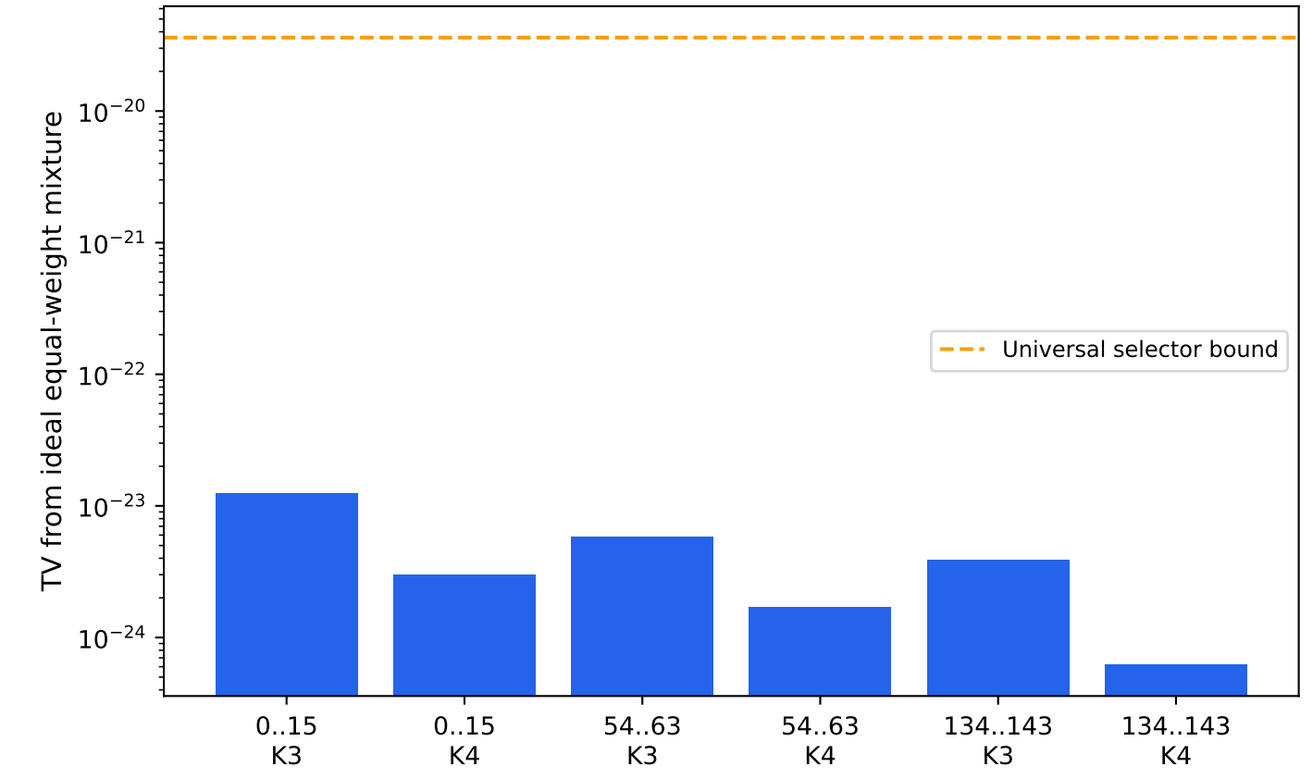
A 16-bit replay anchors and new 10-bit windows



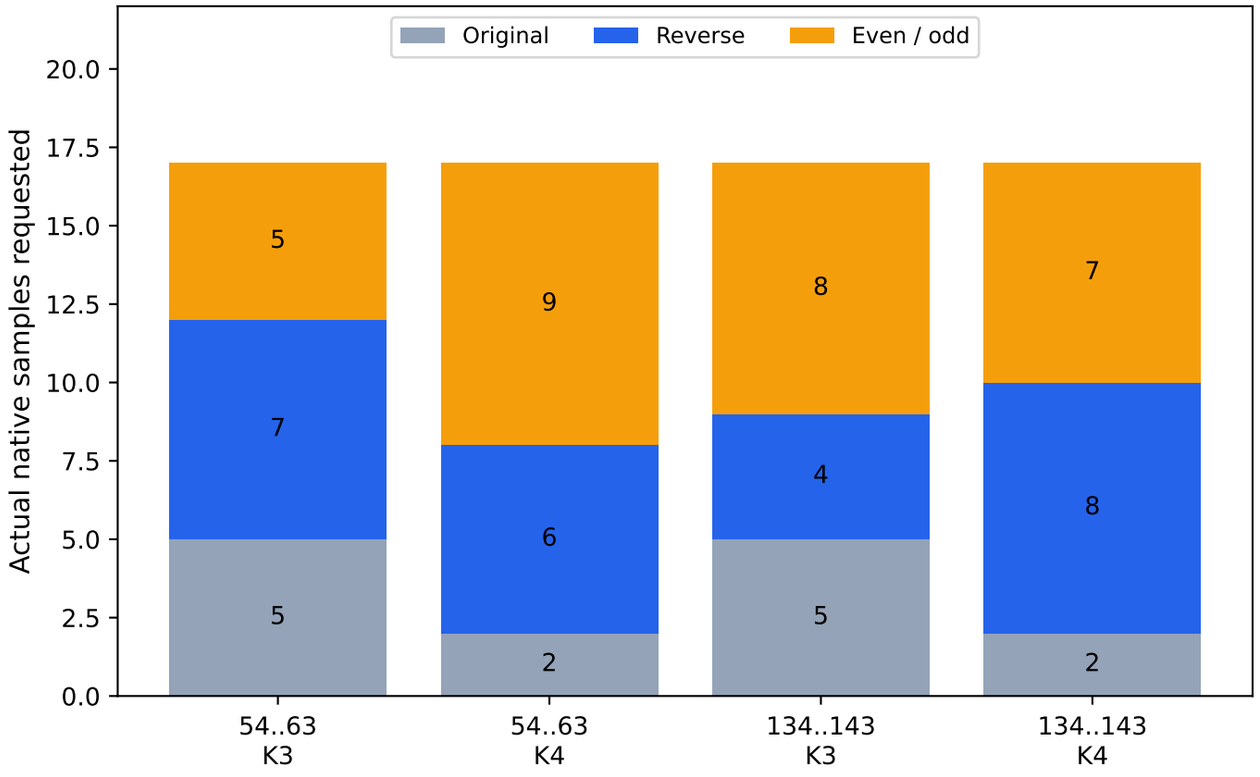
B New windows: negative means smaller



C Exact finite-word selection error



D 17 outputs per group, one component each



All windows belong to the same previously studied 144-mode input; they are not new physical holdouts.
Prefix TV provides a full-law lower bound, not a ranking of full144 errors. Preprocessing remains separate per order.
